There are 6 questions in this paper, do not be deterred, they are all straightforward. Read each question carefully. There are questions on both side of the page. The number of marks for each question are given in brackets. Be smart about how you answer. If you can't answer one question move on the to next and return to the questions you could not do after answering all the other questions!

Rubric: This exam is an open book exam you can use all written materials that you want, normal tables and a calculator.

Write your solutions in the question paper.

Spare page.
(1) Suppose you can draw from the following four populations and calculate the sample mean. Which population with sample would you choose, and explain why?
(A) The population variance is 1 the sample size is 40 .
(B) The population variance is 2 the sample size is 80 .
(C) The population variance is 0.25 the sample size is 20 .
(D) The population variance is 0.5 the sample size is 60 .
(2) A doctor wants to investigate the probability that two siblings (brothers and/or sisters) are over 9.5 pounds. She uses the following information.
The probability a randomly selected newborn baby is over 9.5 pounds is 0.05 .
The probability that a new born baby is over 9.5 pounds given that its older sibling birth weight is over 9.5 pounds is 0.2 .
(a) Calculate the probability that both siblings are over 9.5 pounds.
(a) Based on the information above do you think the birth weight of siblings are independent of each other? Give a reason for your answer.
(3) A draw 200 random samples, each sample is of size $40(n=40)$. For each sample, I construct a $90 \%$ confidence interval for the mean. On average how many of the confidence intervals will not contain the population mean.
(4) Consider a population which has mean $\mu$ and variance 2. Suppose we draw random samples of size $n=10, n=50$ and $n=200$, and for each sample we calculate the sample mean $\bar{X}$. In the boxes below draw the distribution of $\bar{X}$ for $n=10, n=20$, $n=50$ and $n=200$. Indicate the mean and standard error of $\bar{X}$ on the plot.

$$
\mathrm{n}=10
$$

$$
\mathrm{n}=50
$$

(5) I draw of random sample of 15. The QQplot is given below. Suppose that the sample mean is $\bar{X}=0.606$ and the population variance is $\sigma^{2}=1$.

(a) Construct a $95 \%$ for the sample mean.
(b) Based on the QQplot comment on whether the $95 \%$ CI for the sample mean is reliable. Give a reason for your answer.
(6) Anthropologists are trying to classify what they believe are ancient handaxes (ancient knives) made by early hominid (ancient humans) found in the Olduvai Gorge, in East Africa.
It is known that axes made by Ancient Human species A has mean length 2 inches.
But Ancient Human species B had learnt to make longer handaxes. These hand axes had mean length longer than 2 inches.
It is known that the standard deviation of all handaxes from this age is about $\sigma=2$ inches.
(i) Suppose we want to construct a $99 \%$ CI for the mean handaxe length from the Olduvai Gorge, and we want the $99 \%$ CI to have length 0.05 inches, how should we choose the sample size?
(ii) Anthropologists are collecting ancient handaxes samples from the Olduvai Gorge. They want to investigate whether the handaxes found in this particular site were made by Human species B.
State the null and alternative hypothesis that the Anthropologists want to investigate.
(iii) Suppose that the anthropologists collect a random sample of 30 handaxes. Based on this sample, the sample mean is $\bar{X}=3$ inches. Test the hypthesis stated in (ii) (do the test at the $5 \%$ level).

(iv) Suppose that another group of anthropologists collect a random sample of 25 handaxes. Based on this sample, the sample mean is $\bar{X}=1$ inches. Test the hypthesis stated in (ii) (do the test at the $5 \%$ level).

Please turn over page.
(v) What is the chance of rejecting the null if the sample size is $n=20$ and the alternative is that the mean axe length is greater than 4 inches.
